Dear Hiring Manager,

I am writing to apply for the Full-Stack Engineer role. With over three years building and operating end-to-end web applications, from responsive React front ends to containerized backend services, I enjoy owning features from concept to production and improving performance and reliability across the stack. Xsolla's work across payments, gaming, and digital commerce is exactly the kind of environment where I want to grow.
Most recently at Taja, I have built features end to end across React front ends and Go/Node.js microservices. I develop event-driven services using message queues and provider-agnostic integrations with automatic failover, containerize services with Docker, deploy to Kubernetes, and maintain CI/CD pipelines and automated tests. I monitor and debug my own code in production using distributed logging, metrics, and alerting with Grafana and Sentry, and I participate in incident response – so I am comfortable joining an on-call rotation from day one. Optimizing queries, indexes, and service paths has cut average request latency by 20%.
At Kite, I architected a unified API layer that consolidated several payment providers behind a single interface used by multiple client applications, with event-based communication between services, improving reliability to 99.9% uptime and reducing repeat production incidents by over 50%. At LocalRamp, I led end-to-end development of a payments and digital commerce platform handling millions in monthly volume, deploying containerized services on AWS and GCP and using cloud logging and monitoring to debug production behavior.
I bring TypeScript, Go, and Python; React, Docker, Kubernetes, and CI/CD; and PostgreSQL, Redis, and Kafka-style messaging. I am curious, detail-oriented, and collaborative, and I would welcome the opportunity to build full-stack experiences that power impactful products with your team.

Sincerely,
Iyanuoluwa I. Taiwo
