Dear Hiring Manager,

I am writing to express my interest in the Backend Engineer position. With three years of experience building scalable fintech systems in TypeScript, Node.js, and SQL, I have designed APIs, payment integrations, and database structures that perform reliably under real production load.

At Taja, I design and maintain RESTful APIs powering web and mobile products, collaborating with the frontend team to define data contracts that reduced client-side data fetching by 20%. I optimized SQL queries and indexes to improve API response time by 20% and integrated a wide range of external APIs for payments and identity verification, building provider-agnostic abstraction with automatic failover so requests route to backup providers when a single service fails. I also implemented device fingerprinting and abuse-detection systems that reduced account takeover incidents by 30%.

At LocalRamp, I led the frontend and backend development of a high-volume, PCI-DSS-compliant fiat-to-crypto gateway processing millions in monthly transaction volume. I built a real-time analytics dashboard adopted by 300+ enterprise clients and reduced CI/CD pipeline duration by 70% by streamlining build and deployment stages.

More recently at Kite, I architected a unified API layer around major payment providers, maintaining 99.9% system uptime, and introduced automated regression testing that cut production bug escapes by over 50%.

I work across PostgreSQL, MongoDB, Redis, and infrastructure like Docker and Kubernetes, and I enjoy owning everything from data modeling and queue-based processing to monitoring and debugging production issues. I would welcome the opportunity to discuss how I can contribute to your engineering team. Thank you for your time and consideration.

Sincerely,
Iyanuoluwa I. Taiwo
