Dear Hiring Manager,

I am writing to apply for the Technical Customer Support Specialist role. With over three years troubleshooting REST APIs, integrations, and production issues for SaaS/B2B customers, I work comfortably at the intersection of APIs, telephony, and AI-powered products, and I would welcome the chance to do that for a fast-growing voice and speech technology company.

At Taja, I support enterprise customers and partners integrating payment and identity-verification APIs, diagnosing request failures, authentication errors, and webhook delivery problems to first resolution. I also support Twilio voice and messaging integrations, troubleshooting call and SMS delivery failures, webhook callbacks, and configuration issues. Because I build these integrations as well as support them, I can read a failing request, reproduce it against production data with SQL, and either resolve it directly or hand engineering a precise, well-documented escalation. I have built provider-agnostic integrations with automatic failover so live integrations stay up when a provider degrades.

I also have hands-on experience supporting AI/LLM-powered features. I built a natural-language assistant that answers tenant questions over live usage data, and I have debugged retrieval and response-quality issues reported by customers – work that maps closely to supporting AI and speech products in production.

At LocalRamp, I provided end-to-end technical support for 300+ enterprise customers integrating a payments gateway, investigating production issues using GCP Cloud Logging and monitoring dashboards, and tracing errors across services. I introduced a structured triage and escalation workflow that cut average resolution time from 48 hours to under 12 hours, and I authored API documentation and troubleshooting guides that reduced customer onboarding time by 40% and recurring ticket volume by 25%. At Kite, I reduced repeat incidents by over 50% through systematic investigation and automated regression checks.

I bring Python, SQL, and log-analysis skills; REST API, webhook, and Twilio integration experience; and a support-first mindset in a high-growth startup environment. I would welcome the opportunity to discuss how my experience can help your customers get the most out of your platform.

Sincerely,
Iyanuoluwa I. Taiwo
